

ABSTRACT OF THE INVENTION

A receiver of a cordless input apparatus, providing signal reception of wireless transmission for at least two types input devices. The receiver has a primary receiving module and a secondary receiving module. The primary receiving module is used to receive a wireless signal transmitted from one of the above input devices, while the secondary receiving module is used to receive a wireless signal from the other one of the above input devices. The primary and secondary receiving modules are electrically connected to each other by a transmission interface in a plug-in fashion. Thereby, the user can simultaneously use these two input devices to control a computer, while these two input devices can be used separately as well.
